

Participatory Sensing: citizen science, scientific citizens, computational thinking

Deborah Estrin, UCLA CS and CENS, destrin@cs.ucla.edu
In collaboration with faculty, students, staff at CENS

Enabled by $>3 \times 10^9$ mobile
phone users, increasingly
with gps, imagers, UI

Motivated by 6×10^9
people on planet earth
and their concerns...

Acknowledgments: Collaborators and Sponsors

Some definitions to start...

- **Participatory Sensing:** an approach to data collection and interpretation in which individuals, acting alone or in groups, use their personal mobile devices and web services to systematically explore interesting aspects of their worlds ranging from health to culture.

continuum from automated sensing to participatory observation

- **Citizen Science:** scientific work in which individual volunteers or networks of volunteers, many of whom may have no specific scientific training, perform or manage research-related tasks such as observation, measurement or computation (Wikipedia).

continuum from crowd sourcing (SETI at home, mechanical turk)...to engagement

- **Scientific Citizens:** [systematic](#) knowledge-base or prescriptive practice that is capable of resulting in a prediction or predictable type of outcome. (Wikipedia) as applied to our roles as citizens and community members

- **Computational Thinking:** a new way of solving problems ...uses many of the same techniques used by computer science...algorithmically solve complicated problems of scale....novel approaches to problem solving...conducting experiments that apply novel computing concepts to problems to show the value of computational thinking. (Wikipedia, CMU)

Participatory Sensing

enabled by mobile (smart)phones + web + social networking

An approach to data collection and interpretation in which individuals, acting alone or in groups, use their personal mobile devices and web services to systematically explore interesting aspects of their worlds ranging from health to culture.

real time
(always on)

real place
(always carried)

real context
*(historical, environmental,
spatial, social)*

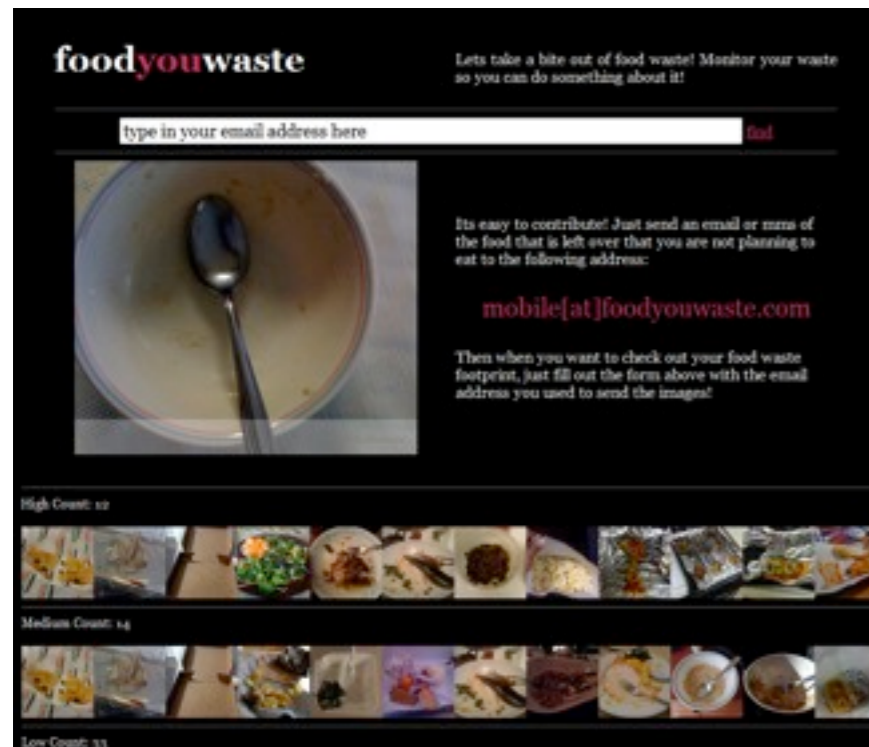

real applications
*(civic and environmental data,
transportation, health, education)*

Campaigns - focused, lightweight, easy to create/join/analyze

<http://garbagewatch.com/>

<http://foodyouwaste.com/>

Distributed data gathering challenges

- Spatially and temporally constrained, systematic data collection operations.
- Exploring a single hypothesis/phenomena/theme.
- Using human-in-the loop sensing to gather data.
- With automatic and manual tagging (classification), auditing, and analysis.
- Precedent : Community-Based Participatory Research, Photo Voice

Approach scales *down* as well as *up*

- Even useful at small n
- Real use can drive and guide innovation

Civic and environmental data campaigns

leveraging coordinated, real-time, geo-coded, tagged, images and prompted entries

Capture your life in data. One tweet at a time.

Get Started Now »

Step 1. Follow [@yfd](#) on Twitter

Step 2. [Sign in to your.flowingdata with Twitter](#)

Step 3. Start recording data (via direct messages) following a few simple guidelines

Making Choices

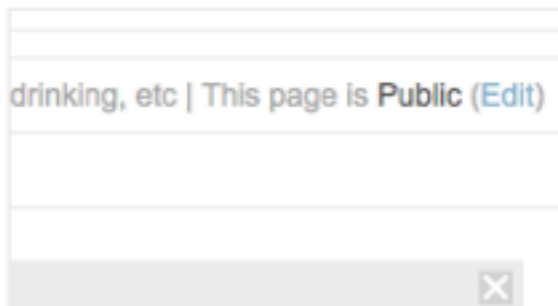

We make tiny choices every day. Those choices become habits, and those habits develop into behaviors. *your.flowingdata* helps you record these choices.

[READ MORE](#)

Collect data anywhere.

The ubiquity of Twitter allows you to record data from just about anywhere. If you can tweet, you can record data.

Share your findings.

Some data is meant to be private, but some is worth sharing. You decide what others can and can't see.

Interact with your data.

Data is meant to be played with. Use interactive data visualization and explore your data.

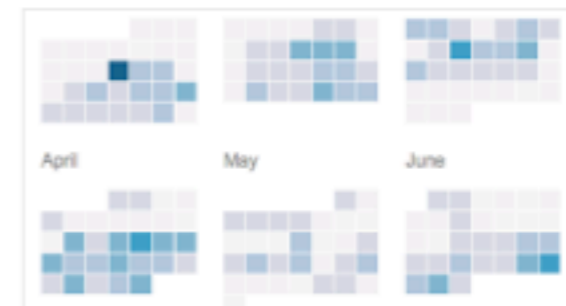

Understand yourself.

In the same way you can see growth from reading old entries in a diary, monitor your growth and progress through data.

Customize views to your data.

All data is not created equally. Create custom visualization pages for what you're most interested in.

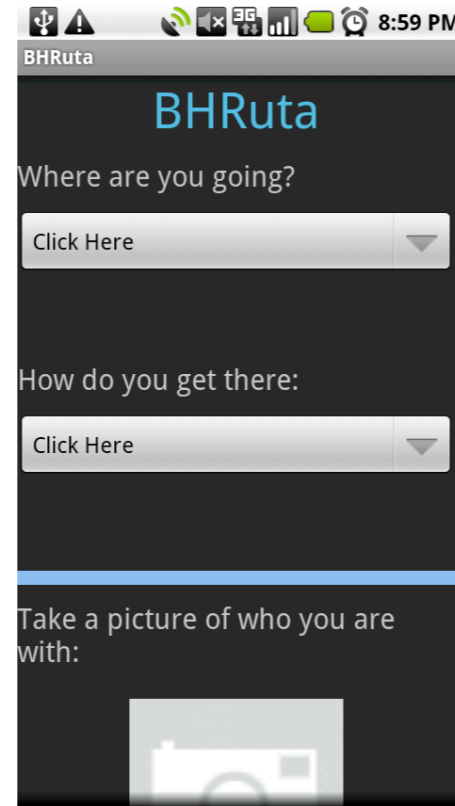

Explore your data easily.

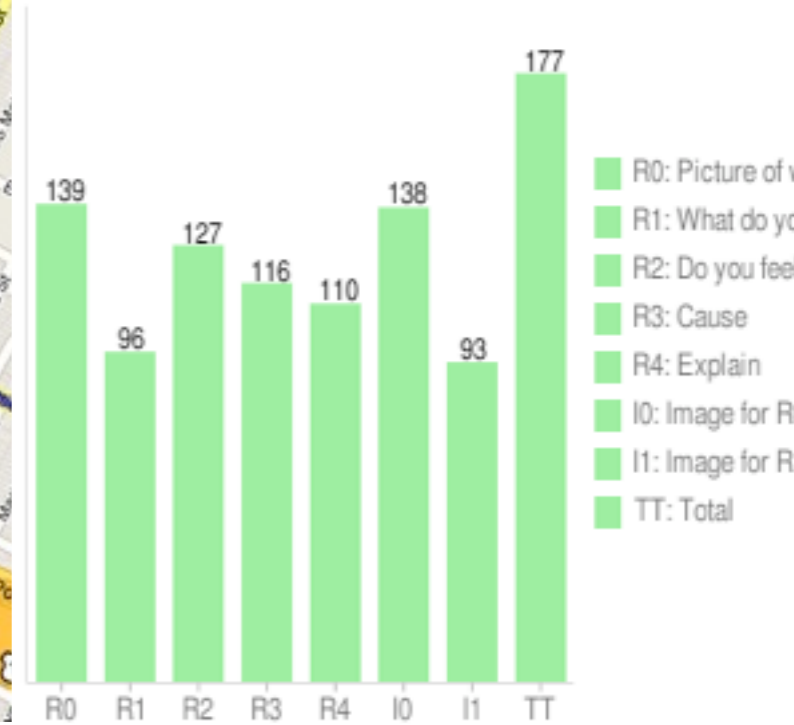

your.flowingdata was designed by a statistician, but you don't have to be one to play with your data.

Healthier communities: Building a Healthy Boyle Heights

“ ... Typically planning processes and planners come in and plan with an outside perspective instead of looking at existing patterns of resident flow.”

BHVecindario_Totals

- ~100 residents/6 weeks documenting conditions in and between work, school, home.
- Where they go and gather, the conditions surrounding them.

Place you stopped. What are you doing: Other groceries	What represents your neighborhood: street name	How do you get there? Walk What where you ate along the way: Street vendor	What did you eat along the way: Other tacos
			

Participatory sensing as a tool for (teaching) Computational Thinking

- Computational thinking and data in everyday life
- Stresschill mapping pilot w/ ~300 high school students in LA
- Inquiry-based observation, analysis: biological, physical, environmental, social sciences, arts/culture
- critical thinking teaching opportunity: personal privacy, how computational thinking can lead to alternative realities

2010 UCLA CENS High School Scholars Summer Program

Engaging high school students in authentic research experiences

The Center for Embedded Networked Sensing (CENS) at UCLA is offering a unique opportunity for LAUSD high school students to gain first-hand experience in cutting-edge research that has direct impacts on scientific and social communities. Selected CENS High School Scholars will be a part of an 8 week summer research program in which students will participate in hands-on computer science research, learn more about life as a college student, and prepare for college and future careers. Women and underrepresented students are encouraged to apply.

Program Overview

- Eight week summer internship experience on the UCLA campus
- Direct involvement in hands-on computer science research in a nationally recognized lab
- Introduction to CENS technology and programming cell phones
- Participation in a community of faculty,

Building an Engaging Curriculum— Focused on Computational Thinking

Jane Margolis, et al

Instructional Units

1. Human Computer Interaction
2. Problem Solving with Computer Science
3. Web Design
4. Introduction to Programming (Scratch)
5. Robotics
6. Data Analysis (Python or R/ Participatory Urban Sensing)

College-Preparatory Math Elective Credit

Exploring Computer Science in LAUSD

20 High schools

Over 900 Students

Almost All Students of
Color--
(Latino/a,
African American,
Asian)

LAUSD Breakdown by gender and race of students who

LAUSD	Female	Males	TOTAL
Latino	246	398	507
African American	46	48	94
Asian	28	54	82
Unknown			45
White	18	25	43
Filipino	4	7	11
Pacific Islander	0	2	2
TOTAL	342	534	921

OAKLAND, SAN JOSE WILL BEGIN THIS YEAR

**PLANS UNDERWAY IN CHICAGO, SAN DIEGO,
OREGON**

Personal privacy presents a teaching opportunity for critical thinking and Computational Thinking

Sensitive data

- Quantify habits, routines, associations
- Increasingly easy to share, mine
- Anonymizing location traces/geocoded time series is often infeasible
- Available to government, insurance, employers, creditors, ...

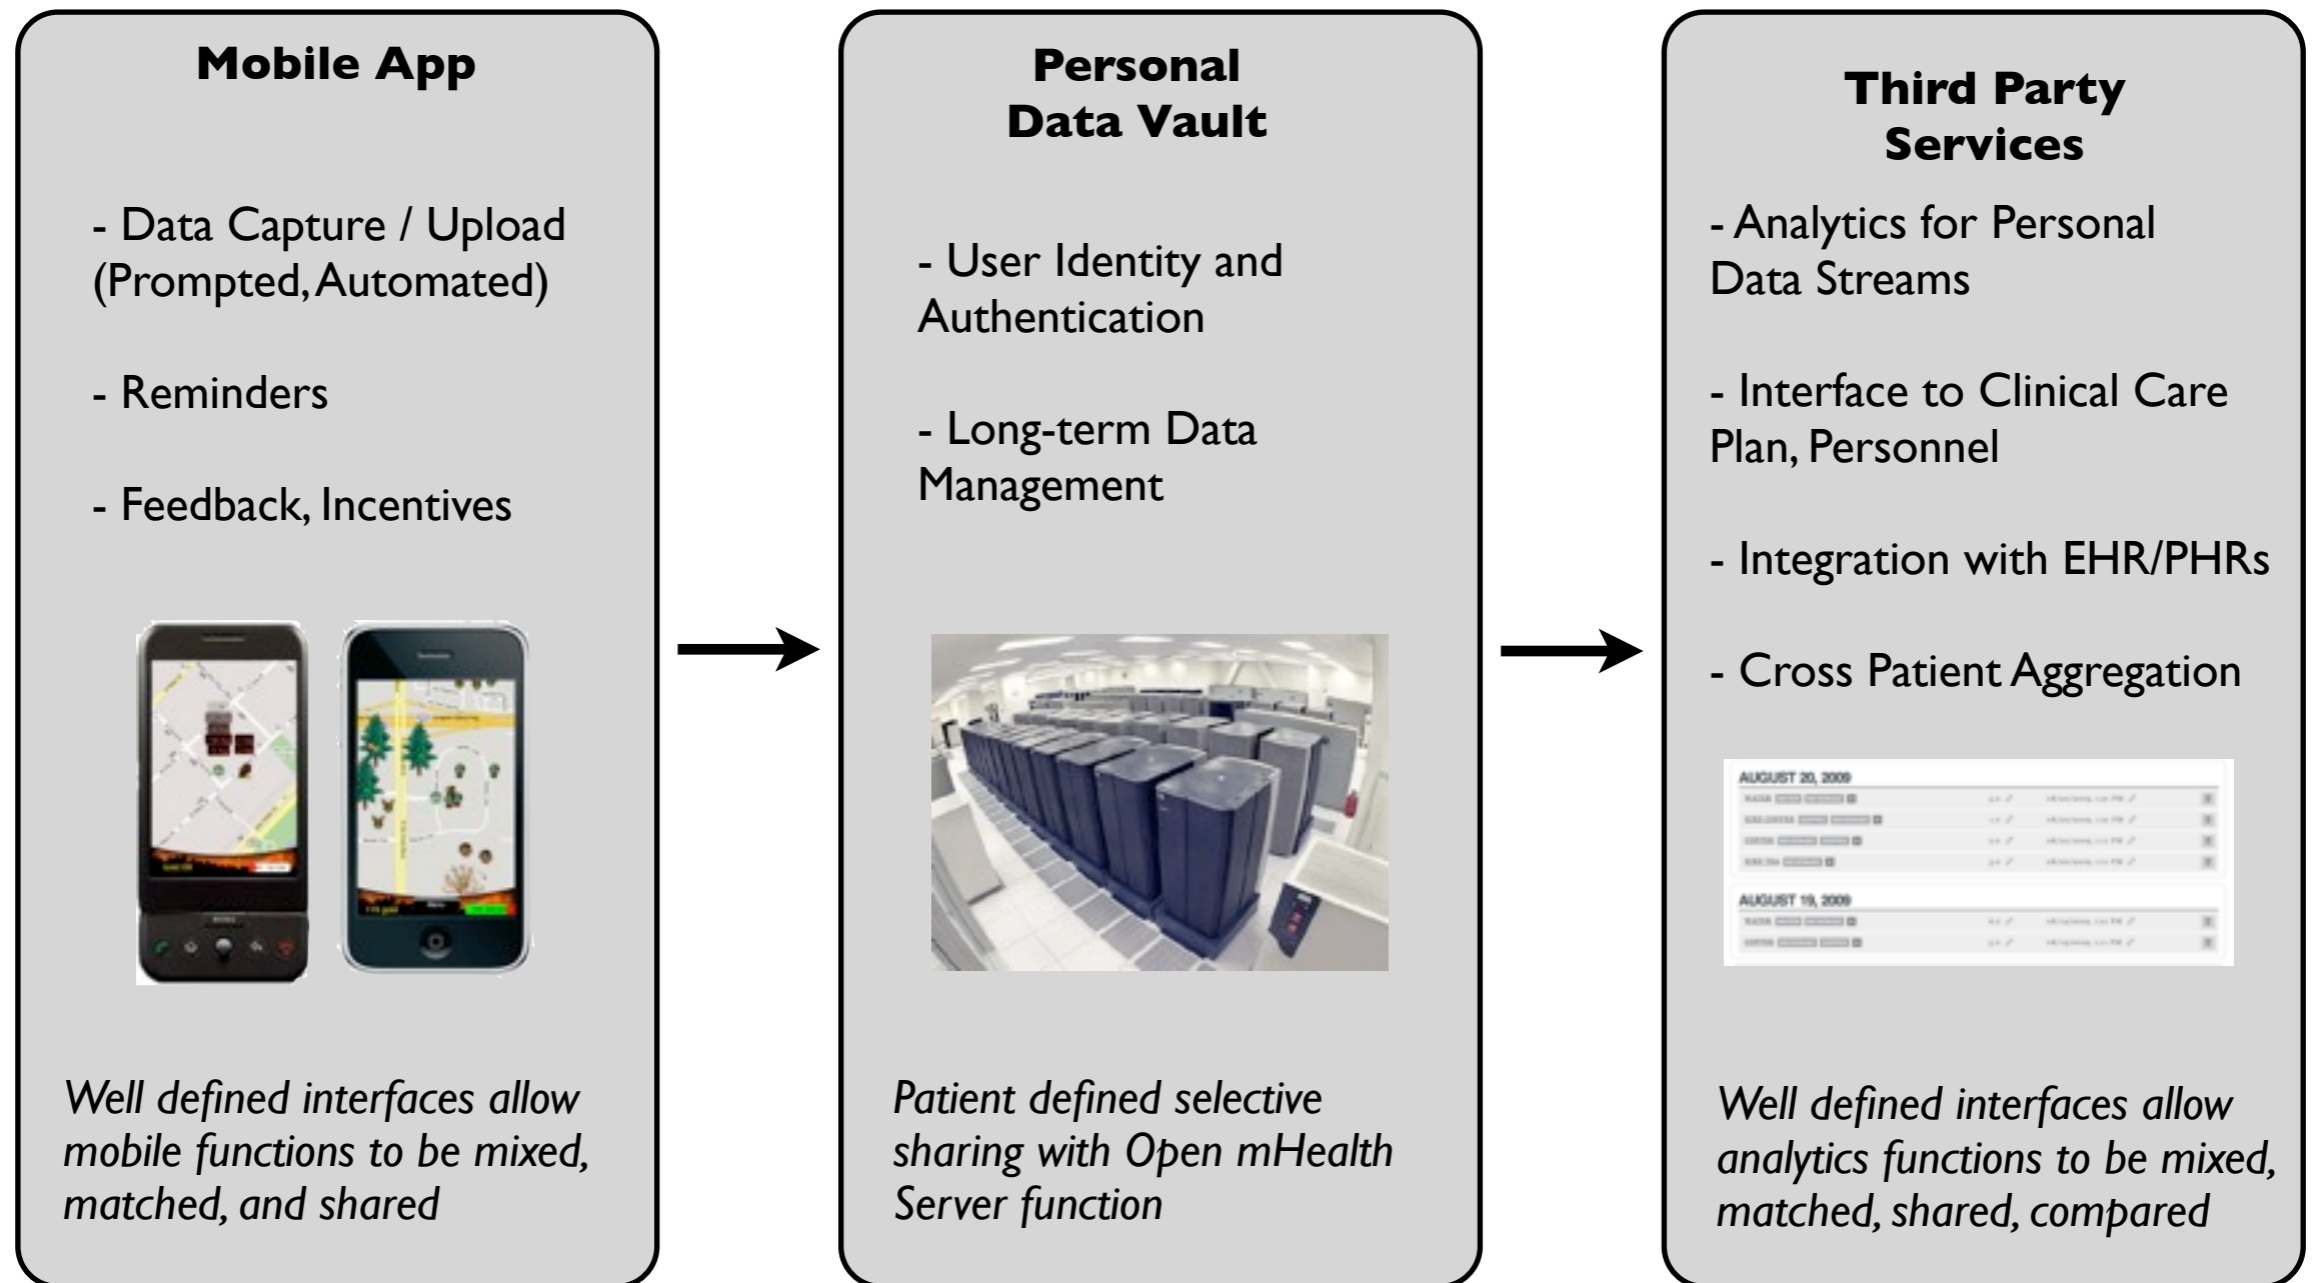

Diverse usage

- Collected by individuals
- Using apps authored by ... anyone?
- Shared with nobody, everybody, or some set in between

Personal Data Vault (PDV):

allow participants to retain control over their raw data

vault + filters = granular, assisted control over what you send to who, what that data says about you, whether you reveal who you are or share anonymously, ...

Conclusion

If you can't go to the field with the sensor you want...go with the sensor you have!

Participatory Sensing can bring computational thinking to the classroom and the livingroom.

It takes a healthy research ecosystem to bring information technology innovations to meaningful societal use
